

Uniblitz® FS25

25mm Uni-Stable Optical Shutter

Overview

The Uniblitz FS series shutters are designed and optimized to operate directly from +5VDC and do not require a separate driver. Removing the +5VDC (0VDC) closes these shutters. A simple control circuit can be used to operate these shutter devices from a TTL trigger pulse. This control can be also accomplished with our new **VLM1 TTL control interface module**, which is now available.

This low-cost innovation provides the reliability of Uniblitz shutters (typical lifetime >1 million cycles) at a single operating voltage.

Time (msec.)

O - A	Delay time on opening after current applied	7.0
A - C	Transfer time on opening	9.0
O - C	Total opening time	16.0
C - E	Min. dwell time with min. input pulse	15.0

¹ Under no circumstances should any type of lubricant be applied to the shutter blade area. Lubricating the shutter blades will likely slow the shutter down and may eventually render it inoperable.

² Various mounting methods available depending on housing option.

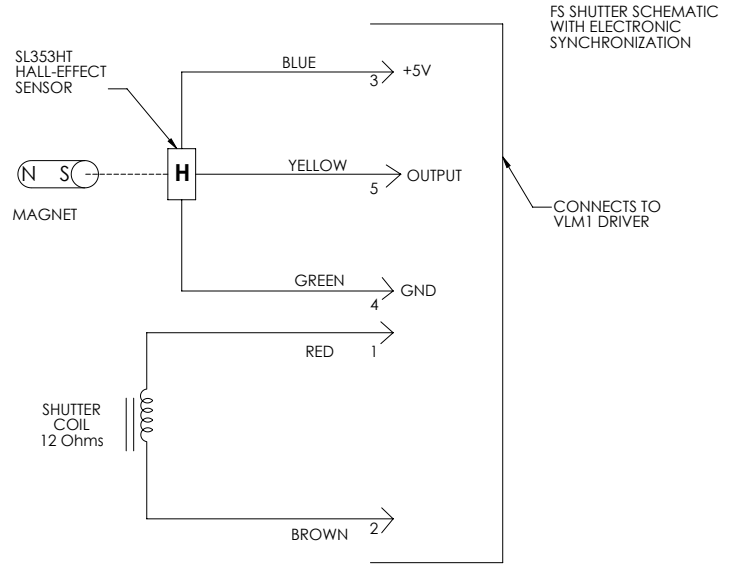

³ Other blade coating options may be available by special order.

⁴ Input side only; Teflon® coating is on opposite side to protect shutter blade surface. Light source must be input to the reflective side only.

⁵ Vacuum compatibility up to 10E-10 Torr.

Electronic Sync.

The synchronization system for FS shutter devices incorporates a small magnet mounted to the driving mechanism and a Hall effect sensor. When the device achieves approximately 80% of full open, the magnet causes the Hall effect sensor to change state, producing a signal to indicate that the shutter has switched to the active state. Shown to the left is the FS series shutter schematic which incorporates the electronic synchronization system. There is no connection to the designated synchronization pins when an electronic sync. is not selected.

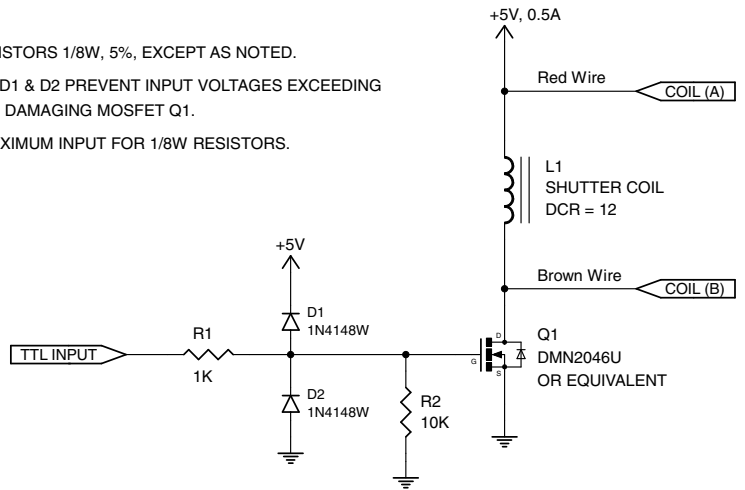

Typical Control Circuit

This simple control circuit to the right can be used to operate the shutter device from a TTL trigger pulse.¹ This control can also be accomplished with the [VLM1 interface module](#).

¹ Note that the shutter will not operate directly from a TTL signal.
